**Subject:** AllBookCovers-com App - the Nanobox Run command Questionnaire

I've created a empty Folder Root Direcotry on my local and ran nanobox run and the questions im unsure of: can you help? Or should I not do this yet, though it says I can reconfigure it at any time, If I want VirtualBox or the Docker Native one.

```
cmd Command Prompt - nanobox run
C:\Users\paul>docker --version
'docker' is not recognized as an internal or external command,
operable program or batch file.

C:\Users\paul>cd C:\Users\paul\Desktop\CloneNanobox2018AllBookCovers
C:\Users\paul\Desktop\CloneNanobox2018AllBookCovers>nanobox run

CONFIGURE NANOBOX
-----
Please answer the following questions so we can customize your
nanobox configuration. Feel free to update your config at any
time by running: 'nanobox configure'

(Learn more at : https://docs.nanobox.io/local-config/configure-nanobox/)

How would you like to run nanobox?
  a) Inside a lightweight VM
  b) Via Docker Native

  Note : Mac users, we strongly recommend choosing (a) until Docker Native
  resolves an issue causing slow speeds : http://bit.ly/2jYFFWQ

Answer: a

How many CPU cores would you like to make available to the VM (1-4)?
-----
  Note : we recommend 2 or more

Answer:
```

**For now I chose the A.) option Inside a LightWeight VM. But I can cancel if you recommend the other?**  
How many cores do I need?  
Then What do you recommend for remaining answers?

My current Pagodabox cloned local repo sits here but I have not updated this clone yet if I have to manually with commands again in git bash or cli.

If I need to be in the Local repo directory which comes from pagodabox remote storage app as last that I know of, I used git bash with the git gui windows software and it sits here:

**C:\Users\paul\Desktop\GitClone2017AllBookCoversPagodabox\www-allbookcovers-com-v2**

**My questions since I'm not wanting to be in the dark**

**here because I don't know what has been done so far...being first time working with this new infrastructure and migrating to Nanobox:**

Do I need to be in this with in Cli then run the > Nanobox run ?

(I've seen Documentation on the webpage of Cli Commands if its useful here: <https://docs.nanobox.io/cli/> )

I've already been thru this step to completion of Linking DigitalOcean Provider to Nanobox or vice versa:

<https://docs.nanobox.io/providers/hosting-accounts/digitalocean/>

**Whats the status on our boxfile now in the boxfile.YML extension format?**

**Have you at Nanobox built an ENGINE for it yet? I've seen the documentation on your website sample boxfile formatting its somewhat familiar, not that ill need this directly or exactly but its just for format reminding to me.**

Or do I need to run a > Deploy to Dryrun ?

Do I need to launch my app yet or Is this automatic?

Do I need to configure our app?

Do I need to as Documentation says many things like: "add my Live App as a Remote " n order to deploy code to live app?

Do I need to Deploy to Production at this moment?

What is Contiguous Integration and Contiguous Deployment Server useful for (CI/CD)? Is this automatic feature I don't have to worry about that works in background?

Why Is it special?

We must make sure I can have certain directories such as the App/public for Uploads, ill be working with most often as we have through the years of our website maintenance and updates, jpg's media files, etc, even certain template code may have certain updates or tweaks if necessary. Which m sure I can just add to the boxfile if necessary if not, is that automatic for some directories? **We will want to FTP upload or SSH in with Filezilla using a Key as we have done with Pagodabox for a couple network or storage directories on Remote end.**
